Outline

- 1 Introduction
- 2 Related work
- **3** Modality Hallucination Model
- **4** Experiments
- **5** Conclusion

Introduction

Use available paired RGB-d training data to learn to hallucinate mid-level convolutional features from a RGB image for **object detection** task.

Introduction

- Task: Object Detection
- Framework: Deep Learning (Convolutional Neuron Networks)
- What's new: Additional ConvNets to extract depth features from RGB image (modality hallucination)

Results

RGB object detection:

34.0 mAP (this work) vs 29.9 mAP (Fast R-CNN)

Figure 4: Example Detections on the NYUD2 test set where our RGB hallucination network's (green box) top scoring detection for the image is correct while the baseline RGB detector's (red box) top scoring detection is incorrect.

Related Work

- Object detection using deep learning
 - RGB^[6]
 - RGB-d^[7]
- Transfer Learning^{[8][9]}
- Learning using side information^[10]
- Network distillation^{[11][12]}

Related Work

Object detection using deep learning

- RGB^[6]
- RGB-d^[7]
- Transfer Learning^{[8][9]}
- Learning using side information^[10]
- Network distillation^{[11][12]}

Object Detection

- Extract region of interest (region proposal)
- Classification of this region
- Result: Region (bounding box coordinates) + Category

Object Detection

Figure 4: Example Detections on the NYUD2 test set where our RGB hallucination network's (green box) top scoring detection for the image is correct while the baseline RGB detector's (red box) top scoring detection is incorrect.

State of the art

- Fast R-CNN (Mean Average Precision: 29.9%)^[6]
- RGB-d Fast R-CNN (Mean Average Precision: 44.4%)^[7]

Observation

Object detection can be improved significanly with **RBD-d images** (additional modality, complementary information).

Problem

Not all RBG images have corresponding depth information.

Idea

How about extracting depth features from RGB images?

◆□▶ ◆□▶ ◆ ≧▶ ◆ ≧▶ ≧ のへで 15/55

Related Work

- Object detection using deep learning
 - RGB^[6]
 - RGB-d^[7]
- Transfer Learning^{[8][9]}
- Learning using side information^[10]
- Network distillation^{[11][12]}

Transfer Learning^{[8][9]}

- Transfer learning and domain adaptation which learns to share information from one task (**Obj detection using depth features**) to another (**Obj detection with RGB features**).
- Previous work used depth information at training time to inform RGB test time detection by learning transformations into a **single representation** for the joint modality space.
- This work focuses on learning an additional RGB representation, which is the hallucination network.

Learning using side information^{[10][13]}

- Learning algorithm has additional knowledge at training time, whether meta data or an **additional modality**.
- Use this extra information to inform training of a **stronger model** than could be produced otherwise, e.g. surface normals at training time could produce detection improvement.

Network distillation^{[11][12]}

- Network Distillation: The output from one network (depth network) is used as the target probability distribution for a new network (hallucination network). Input can be different.
- This approach can also be seen as using distillation to learn representations on RGB images by **transferring supervision** from paired depth images, by employing joint training.

Hallucination Network (Training time)

Sharing depth modality infomation with RGB through hallucination network.

Hallucination Network (Test time)

Given **only a RGB image** and regions of interest, pass through both the RGB network and the hallucination network to produce **two scores** per category, per region, which we **average** and take the softmax to produce our final predictions.

1. A convolutional neuron network (Hallucination network) whose input is a RGB image.

2. The **features maps** generated by this network is as identical as possible to the ones generated by depth ConvNets.

3. A network whose input is RBG image generates depth features.

4. Similar feature maps but different convolutional kernels (weights) because of different input modalities.

Architecture Definition

Multi channels ConvNets:

- RGB Network
- Hallucination Network
- Depth Network

The base network structures can be AlexNet / VGG (to extract features).

Modality Hallucination Model

Multi-task Optimization with hallucination loss.

◆□ ▶ < 畳 ▶ < 置 ▶ < 置 ▶ Ξ • ⑦ Q ○ 31/55</p>

Activations after some layer, l, should be similar between the hallucination and depth networks.

Euclidean loss: $L_{hallucinate}(l) = \left\|\sigma(A_l^{dNet}) - \sigma(A_l^{hNet})\right\|_2^2$ where $\sigma(x) = 1/(1 + \exp(-x))$ (sigmoid function) and l = layer

Asymmetric transfer of information: $\mathbf{0}$ learning rate lower than l

▲□▶ ▲圖▶ ▲ 필▶ ▲ 필▶ ■ ♡ Q ♡ 35/55

- 11 total losses:
 - 5 softmax cross-entropy losses for classification
 - 5 smooth L1 losses for **bounding box** coordinates regression
 - 1 hallucination loss

Figure: Network Structure¹

< □ ▶ < @ ▶ < ≧ ▶ < ≧ ▶ E のへで 39/55

Balancing objectives

$$\begin{split} \mathcal{L} &= \gamma \mathcal{L}_{\text{hallucinate}} \\ &+ \alpha \left[\mathcal{L}_{\text{loc}}^{\text{dNet}} + \mathcal{L}_{\text{loc}}^{\text{rNet}} + \mathcal{L}_{\text{loc}}^{\text{hNet}} + \mathcal{L}_{\text{loc}}^{\text{rdNet}} + \mathcal{L}_{\text{loc}}^{\text{rhNet}} \right] \\ &+ \beta \left[\mathcal{L}_{\text{cls}}^{\text{dNet}} + \mathcal{L}_{\text{cls}}^{\text{rNet}} + \mathcal{L}_{\text{cls}}^{\text{hNet}} + \mathcal{L}_{\text{cls}}^{\text{rdNet}} + \mathcal{L}_{\text{cls}}^{\text{rhNet}} \right] \\ &\alpha = 0.5, \beta = 1, \gamma = ? \end{split}$$

 γ is heuristically set to $\mathbf{10x}$ the contribution of any of the other losses

Experiments

- Base Network: AlexNet, VGG
- Region Proposals: Multiscale Combinatorial Grouping (MCG)
- SGD Hyper-parameters: LR = 0.001, Momentum = 0.9, Weight decay = 0.0005, T = 10 (Threshold of gradient glipping)
