

# **3D Computer Vision II**

# **Reminder** Projective Geometry, Transformations

Nassir Navab

based on a course given at UNC by Marc Pollefeys & the book "Multiple View Geometry" by Hartley & Zisserman

October 21, 2010

## **2D Transformations**

## **2D Transformations**

- Scaling
  - Isotropic Scaling
  - Non-isotropic Scaling
- Rotation
- Translation
- Euclidean Transformation
- Metric Transformation (Similarity)
- Affine Transformation
- Projective Transformation

## **2D Transformations – Isotropic Scaling**

## **2D Transformations – Isotropic Scaling**

• Same scaling factor in both dimensions:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} sx \\ sy \end{bmatrix} = \begin{bmatrix} s & 0 \\ 0 & s \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

## **2D Transformations – Non-Isotropic Scaling**

## **2D Transformations – Non-Isotropic Scaling**

Different scaling factors in the two dimensions:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} s_1 x \\ s_2 y \end{bmatrix} = \begin{bmatrix} s_1 & 0 \\ 0 & s_2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$$

## **2D Transformations – Rotation**

Х

## **2D Transformations – Rotation**

Rotation around origin by angle  $\, heta$ 

**Rotation Matrix** 

$$R = \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}$$

Transformed Point

$$\bar{p}' = R\bar{p}$$

where

$$x' = x \cdot \cos \theta - y \cdot \sin \theta$$

 $y' = x \cdot \sin \theta + y \cdot \cos \theta$ 

#### **2D Transformations – Rotation**

## **2D Transformations – Translation**

## **2D Transformations – Translation**

## **2D Transformations – Translation**

Homogeneous Coordinates:

How to get the translation transformation  $\vec{p}' = \vec{p} + \begin{bmatrix} t_x \\ t_y \end{bmatrix}$  into the *matrix*-vector-product form p'=Ap ?

Homogeneous point:

$$\vec{p} = \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Transformation Matrix:

$$\vec{p}' = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} x + t_x \\ y + t_y \\ 1 \end{bmatrix}$$

## **Homogeneous Coordinates of Points**

Real point [x,y] (homogeneous representation):

$$\begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} \lambda x \\ \lambda y \\ \lambda \end{bmatrix}$$

#### **2D Transformations – Affine Transformations**

#### **2D Transformations – Affine Transformations**

$$\mathbf{x'} = \begin{bmatrix} ax + by \\ cx + dy \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \mathbf{x} = \mathbf{A}\mathbf{x}$$

deformation

$$\mathbf{A} = \mathbf{R}(\theta) \cdot \mathbf{R}(-\phi) \cdot \mathbf{D} \cdot \mathbf{R}(\phi)$$

$$\mathbf{D} = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$$

## **Affine Transformations: Homogenous Coordinates**

$$\mathbf{x'} = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} ax + by \\ cx + dy \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} a & b & 0 \\ c & d & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \mathbf{A}\mathbf{x}$$

## **Homogeneous Coordinates of Points**

- Real point [x,y] (homogeneous representation):
- $\begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} \lambda x \\ \lambda y \\ \lambda \end{bmatrix}$

• Points at infinity:

$$\begin{bmatrix} x \\ y \\ 0 \end{bmatrix} = \lambda \begin{bmatrix} x \\ y \\ 0 \end{bmatrix}$$

• Example: 
$$\begin{bmatrix} x_2 \\ y_2 \\ 1 \end{bmatrix} - \begin{bmatrix} x_1 \\ y_1 \\ 1 \end{bmatrix} \rightarrow \begin{bmatrix} x_2 - x_1 \\ y_2 - y_1 \\ 0 \end{bmatrix}$$

## **Affine Transformations: Points at Infinity**

$$\mathbf{x'} = \begin{bmatrix} x' \\ y' \\ 0 \end{bmatrix} = \lambda \begin{bmatrix} a & b & 0 \\ c & d & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 0 \end{bmatrix} = \lambda \begin{bmatrix} ax + by \\ cx + dy \\ 0 \end{bmatrix}$$

#### **General Affine Transformations (6 Parameters)**

$$\mathbf{x'} = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} ax + by + c \\ dx + ey + f \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} a & b & c \\ d & e & f \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \mathbf{A}\mathbf{x}$$

$$\mathbf{x'} = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} ax + by + c \\ dx + ey + f \\ gx + hy + 1 \end{bmatrix} = \lambda \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \mathbf{H}\mathbf{x}$$

$$\mathbf{x'} = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} ax + by + c \\ dx + ey + f \\ gx + hy + 1 \end{bmatrix} \longrightarrow \begin{cases} x' = \frac{ax + by + c}{gx + hy + 1} \\ y' = \frac{dx + ey + f}{gx + hy + 1} \end{cases}$$

## **Affine Transformations: Points at Infinity**

$$\mathbf{x'} = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \lambda \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 0 \end{bmatrix} = \lambda \begin{bmatrix} ax + by \\ dx + ey \\ gx + hy \end{bmatrix}$$

$$\mathbf{x'} = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \mathbf{H} \begin{bmatrix} x \\ y \\ 0 \end{bmatrix} = \lambda \begin{bmatrix} ax + by \\ dx + ey \\ gx + hy \end{bmatrix} \rightarrow \begin{cases} x' = \frac{ax + by}{gx + hy} \\ y' = \frac{dx + ey}{gx + hy} \end{cases}$$

## **2D Projective Space – The Projective Plane**

- A line in plane can be represented as: *ax+by+c=0*
- We can represent any line *I* by three parameters *a*, *b*, and *c*
- The same line / can be represented by multiples of a, b and c (ka, kb and kc for a scalar k) since: kax+kby+kc=k\*0=0=ax+by+c
- A line is represented by a set of vectors, which differ only in scale k (k non zero)
- This equivalence set of vectors is known as a *Homogeneous Vector*
- Any particular vector of the class is a representative of the equivalence class
- The set of all these equivalence classes (i.e. homogeneous vectors) of vectors in R<sup>3</sup> (excluding (0,0,0)) is called the *Projective Space P*<sup>2</sup>

## **A Model for the Projective Plane**

#### We'll use this intuition throughout the course.

#### **A Model for the Projective Plane**

#### **Homogeneous Coordinates – Points**

- A point is represented in P<sup>2</sup> by a simple vector
- Remember that every vector in P<sup>2</sup> is just a representative of an equivalence class of vectors
- Hence a point is represented by any vector of the equivalence class

#### **Homogeneous Coordinates – Lines**

- In P<sup>2</sup> lines as well are represented as vectors
- Cecause of the equivalence class of vectors, any vector of the class is representative

$$ax + by + c = 0 \qquad (a, b, c)^{\mathsf{T}}$$
$$(ka)x + (kb)y + kc = 0, \forall k \neq 0$$
$$(a, b, c)^{\mathsf{T}} \sim k(a, b, c)^{\mathsf{T}}$$

Note that Points and Lines are represented both in P<sup>2</sup> as vectors

## **Degrees of Freedom (DOF)**

- DOF refers to the number of parameters needed to specify an object in the respective space
- Examples:

## Homogeneous Vectors (in P<sup>2</sup>) have 2 DOF

Any homogeneous vector x (in P<sup>2</sup>) has 3 coordinates but only 2 DOF since it is up to scale – hence only the two ratios  $x_1:x_3$  and  $x_2:x_3$  between the coordinates are significant.

Homogeneous vector x: 
$$(x_1, x_2, x_3)^{\mathsf{T}} = k \cdot (x_1, x_2, x_3)^{\mathsf{T}}$$

The ratios x1:x3 and x2:x3:

$$x_1: x_3 = \frac{x_1}{x_3} = \frac{kx_1}{kx_3}$$
  $x_2: x_3 = \frac{x_2}{x_3} = \frac{kx_2}{kx_3}$ 

#### **Incidence of Points and Lines**

The point x lies on the line I if and only if  $x^TI=I^Tx=0$ 

$$x = (x, y, 1)^{T}$$
 on  $1 = (a, b, c)^{T}$  if and only if  $ax + by + c = 0$   
 $(x, y, 1)(a, b, c)^{T} = x^{T}1 = 0$ 

## **Points from Lines - Intersections of Lines**

The intersection point **x** of two lines  $I_1$  and  $I_2$  satisfies:

$$\mathbf{x}^{t}\mathbf{l}_{1} = \mathbf{x}^{t}\mathbf{l}_{2} = 0 \implies \mathbf{x} = \mathbf{l}_{1} \times \mathbf{l}_{2}$$

#### **Points from Lines - Intersections of Lines**

The intersection point **x** of two lines  $I_1$  and  $I_2$  satisfies:

$$\mathbf{x}^{\mathsf{t}}\mathbf{l}_{1} = \mathbf{x}^{\mathsf{t}}\mathbf{l}_{2} = 0 \quad \Rightarrow \quad \mathbf{x} = \mathbf{l}_{1} \times \mathbf{l}_{2}$$

## **Alternative Notation for the Cross Product**

The cross product of two vectors  $\mathbf{a}$  and  $\mathbf{b}$  ( $\mathbf{a}$ × $\mathbf{b}$ ) can be written as a product of an anti-symmetric matrix  $[\mathbf{a}]$ × and the vector  $\mathbf{b}$ 

 $a \times b = [a]_x b = -[b]_x a$ 

The appropriate anti-symmetric matrix **[a]** is:

$$[a]_{x} = \begin{bmatrix} 0 & -a_{3} & a_{2} \\ a_{3} & 0 & -a_{1} \\ -a_{2} & a_{1} & 0 \end{bmatrix}$$

## **Points from Lines – Intersections of Lines**

The intersection of two lines 1 and 1' is the point  $x = 1 \times 1' = [l]_x l' = -[l']_x l$ 

## **Lines from Points – Line Joining two Points**

The line I joining two points  $x_1$  and  $x_2$  satisfies:

## **Lines from Points – Line Joining two Points**

The line through two points x and x' is the line  $1 = x \times x' = [x]_x x' = -[x']_x x$ 

## **Lines from Points – Line Joining two Points**

The line through two points x and x' is the line  $1 = x \times x' = [x]_x x' = -[x']_x x$ 

#### Ideal Points and the Line at Infinity

Intersections of parallel lines are the points at infinity (ideal points)  $l = (a, b, c)^{T}$  and  $l' = (a, b, c')^{T}$   $l \times l' = (b, -a, 0)^{T}$ 

$$[l]_{x}l' = \begin{bmatrix} 0 & -c & b \\ c & 0 & -a \\ -b & a & 0 \end{bmatrix} \begin{bmatrix} a \\ b \\ c' \end{bmatrix} = \begin{bmatrix} b(c'-c) \\ a(c-c') \\ 0 \end{bmatrix} \approx \begin{bmatrix} b \\ -a \\ 0 \end{bmatrix}$$

Ideal points  $(x_1, x_2, 0)^T$ Line at infinity  $l_{\infty} = (0,0,1)^T$ 

alternative definition of  $P^2$ :  $P^2 = R^2 \cup l_{-}$ 

Note that in **P**<sup>2</sup> there is no distinction between ideal points and others

#### Ideal Points and the Line at Infinity – an Example

## **Duality**

#### Duality principle:

To any theorem of 2-dimensional projective geometry there corresponds a dual theorem, which may be derived by interchanging the role of points and lines in the original theorem.

## Summary

- Projective Space P<sup>2</sup>
- Homogeneous Coordinates
- Points
- Lines
- Points and Lines at the Infinity
- Intersection of Lines: Points
- Connection of Points: Lines
- Duality

CAMP
